

# EXHIBIT 9

**HIGHLY CONFIDENTIAL – ATTORNEYS’ EYES ONLY****Exhibit D - U.S. Patent No. 8,589,541 (“’541 Patent”)**

Accused Instrumentalities: smartphones, basic phones, tablets, laptops, and hotspot devices sold (including those sold in bundles with data plans) or used by Verizon and all versions and variations thereof (“Accused Instrumentalities”) since the issuance of U.S. Pat. No. 8,589,541 (the “Asserted Patent”).

**Claim 1**

Claim	Public Documentation
[1a] A non-transitory computer-readable storage medium storing machine-executable instructions that, when executed by one or more processors of a wireless end-user device, cause the one or more processors to:	The Accused Instrumentalities include “A non-transitory computer-readable storage medium storing machine-executable instructions that, when executed by one or more processors of a wireless end-user device, cause the one or more processors to.”

**HIGHLY CONFIDENTIAL – ATTORNEYS’ EYES ONLY**

	For example, Verizon sells and uses devices described by Verizon’s website below (e.g., devices made by Samsung, Apple, Motorola, Google, and Kyocera). These devices constitute a wireless end-user device as described in claim 1. <i>See, e.g.:</i> <a href="https://www.verizon.com/smartphones/motorola/">https://www.verizon.com/smartphones/motorola/</a> :

Edge 5G UW

## Using power saving mode

[Copy Link](#)

Use emergency power saving mode when your device is low on battery and you still need to be able use some functions on your device.

From the Home screen, drag down the **Notification panel**.

Drag down the **Quick settings** panel.

Swipe to Battery Saver.

Tap **Battery Saver**.

**Note:** Battery Saver mode saves battery power by limiting access to certain apps, including the flashlight. You can also send your location or a text message to an emergency contact.

You've completed the steps!

A screenshot of a smartphone's quick settings menu. The background is dark. At the top, there's a light blue slider bar. Below it are several rounded rectangular tiles: 'Hotspot Off', 'System update >', 'Dolby Atmos Smart audio >', 'Nearby Share >', 'Alarm No alarm set >', 'Battery Saver On' (this tile has a red circular highlight), 'Night light Off', and 'Screen cast Off'. At the bottom, there are three small icons: a pencil, a power button, and a gear icon.

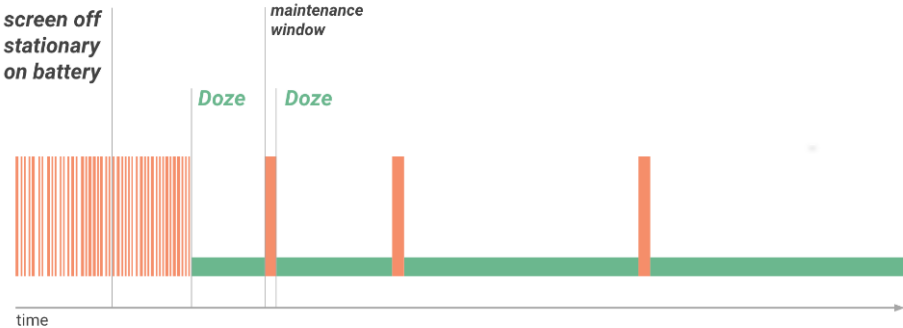

Three circular navigation buttons arranged horizontally. The leftmost button contains a white left-pointing arrow. The middle button is white and contains the text '4/5'. The rightmost button contains a white right-pointing arrow.

Claim	Public Documentation
	<div><h3>Optimize network data usage</h3><p>Over the life of a smartphone, the cost of a cellular data plan can easily exceed the cost of the device itself. On Android 7.0 (API level 24) and higher, users can enable Data Saver on a device-wide basis in order to optimize their device's data usage, and use less data. This ability is especially useful when roaming, near the end of the billing cycle, or for a small prepaid data pack.</p><p>When a user enables Data Saver in <b>Settings</b> and the device is on a metered network, the system blocks background data usage and signals apps to use less data in the foreground wherever possible. Users can allow specific apps to use background metered data usage even when Data Saver is turned on.</p><p>Android 7.0 (API level 24) extends the <code>ConnectivityManager</code> API to provide apps with a way to <a href="#">retrieve the user's Data Saver preferences</a> and <a href="#">monitor preference changes</a>. It is considered good practice for apps to check whether the user has enabled Data Saver and make an effort to limit foreground and background data usage.</p></div> <div><h3>Check data saver preferences</h3><p>On Android 7.0 (API level 24) and higher, apps can use the <code>ConnectivityManager</code> API to determine what data usage restrictions are being applied. The <code>getRestrictBackgroundStatus()</code> method returns one of the following values:</p><div><p><code>RESTRICT_BACKGROUND_STATUS_DISABLED</code></p><p>Data Saver is disabled.</p></div><div><p><code>RESTRICT_BACKGROUND_STATUS_ENABLED</code></p><p>The user has enabled Data Saver for this app. Apps should make an effort to limit data usage in the foreground and gracefully handle restrictions to background data usage.</p></div><div><p><code>RESTRICT_BACKGROUND_STATUS_WHITELISTED</code></p><p>The user has enabled Data Saver but the app is allowed to bypass it. Apps should still make an effort to limit foreground and background data usage.</p></div><p>Limit data usage whenever the device is connected to a metered network, even if Data Saver is disabled or the app is allowed to bypass it. The following sample code uses <code>ConnectivityManager.isActiveNetworkMetered()</code> and <code>ConnectivityManager.getRestrictBackgroundStatus()</code> to determine how much data the app should use:</p></div> <p>; <a href="https://developer.android.com/training/monitoring-device-state/doze-standby">https://developer.android.com/training/monitoring-device-state/doze-standby</a>;</p>

**HIGHLY CONFIDENTIAL – ATTORNEYS’ EYES ONLY**

Claim	Public Documentation
	<div><h2>Optimize for Doze and App Standby </h2><p>Starting from Android 6.0 (API level 23), Android introduces two power-saving features that extend battery life for users by managing how apps behave when a device is not connected to a power source. <i>Doze</i> reduces battery consumption by deferring background CPU and network activity for apps when the device is unused for long periods of time. <i>App Standby</i> defers background network activity for apps with which the user has not recently interacted.</p><p>While the device is in Doze, apps' access to certain battery-intensive resources is deferred until maintenance windows. The specific restrictions are listed in <a href="#">Power Management Restrictions</a>.</p><p>Doze and App Standby manage the behavior of all apps running on Android 6.0 or higher, regardless whether they are specifically targeting API level 23. To ensure the best experience for users, test your app in Doze and App Standby modes and make any necessary adjustments to your code. The sections below provide details.</p></div> <div><h3>Understanding Doze</h3><p>If a user leaves a device unplugged and stationary for a period of time, with the screen off, the device enters Doze mode. In Doze mode, the system attempts to conserve battery by restricting apps' access to network and CPU-intensive services. It also prevents apps from accessing the network and defers their jobs, syncs, and standard alarms.</p><p>Periodically, the system exits Doze for a brief time to let apps complete their deferred activities. During this <i>maintenance window</i>, the system runs all pending syncs, jobs, and alarms, and lets apps access the network.</p><p><b>Figure 1.</b> Doze provides a recurring maintenance window for apps to use the network and handle pending activities.</p></div>

**HIGHLY CONFIDENTIAL – ATTORNEYS’ EYES ONLY**

Claim	Public Documentation
	<div>At the conclusion of each maintenance window, the system again enters Doze, suspending network access and deferring jobs, syncs, and alarms. Over time, the system schedules maintenance windows less and less frequently, helping to reduce battery consumption in cases of longer-term inactivity when the device is not connected to a charger.</div> <div>As soon as the user wakes the device by moving it, turning on the screen, or connecting a charger, the system exits Doze and all apps return to normal activity.</div> <div>The Doze restriction on network access is also likely to affect your app, especially if the app relies on real-time messages such as tickles or notifications. If your app requires a persistent connection to the network to receive messages, you should use <a href="#">Firebase Cloud Messaging (FCM)</a> if possible.</div> <div>; <a href="https://developer.android.com/topic/performance/appstandby">https://developer.android.com/topic/performance/appstandby</a>:</div>

**HIGHLY CONFIDENTIAL – ATTORNEYS’ EYES ONLY**

## App Standby Buckets

Android 9 (API level 28) and higher support **App Standby Buckets**. App Standby Buckets help the system prioritize apps' requests for resources based on how recently and how frequently the apps are used. Based on app usage patterns, each app is placed in one of five priority **buckets**. The system limits the device resources available to each app based on which bucket the app is in.

### Priority buckets

The system dynamically assigns each app to a priority bucket, reassigning the apps as needed. The system may rely on a preloaded app that uses machine learning to determine how likely each app is to be used, and assigns apps to the appropriate buckets. If the system app is not present on a device, the system defaults to sorting apps based on how recently they were used. More active apps are assigned to buckets that give the apps higher priority, making more system resources available to the app. In particular, the bucket determines how frequently the app's jobs run, and how often the app can trigger alarms. These restrictions apply only while the device is on battery power; the system does not impose these restrictions on apps while the device is charging.

★ **Note:** Every manufacturer can set their own criteria for how non-active apps are assigned to buckets. You should not try to influence which bucket your app is assigned to. Instead, focus on making sure your app behaves well in whatever bucket it might be in. Your app can find out what bucket it's currently in by calling [`UsageStatsManager.getAppStandbyBucket\(\)`](#).

The buckets are:

1. **Active:** App is currently being used or was very recently used.
2. **Working set:** App is in regular use.
3. **Frequent:** App is often used, but not every day.
4. **Rare:** App is not frequently used.
5. **Restricted:** App consumes a great deal of system resources, or may exhibit undesirable behavior.

In addition, there's a special **never** bucket for apps that have been installed but have never been run. The system imposes severe restrictions on these apps.

## Reducing data usage by turning on data saver

[Copy Link](#)

Using the Data Saver function on your device can help you lower the amount of data you use. Data Saver will prevent some apps from sending or receiving data in the background.

① Data saver prevents some apps from sending or receiving data in the background.

From the Settings app, tap **Network & Internet**.

Tap **Data Saver**.

Tap or slide the **Use Data Saver** switch to ON.

You've completed the steps!

A screenshot of an Android phone's 'Data Saver' settings page. At the top, there's a title bar with a back arrow, search icon, and info icon. The main heading is 'Data Saver'. Below it is a toggle switch labeled 'Use Data Saver' which is currently turned off. Underneath, there's a section titled 'Unrestricted data' with a subtitle '4 apps allowed to use unrestricted data when Data Saver is on'. At the bottom, there's explanatory text about how Data Saver works to reduce data usage by preventing some apps from sending or receiving data in the background.

A set of navigation controls consisting of three circular buttons. The leftmost button contains a white left-pointing arrow. The middle button contains the text '3/4'. The rightmost button contains a white right-pointing arrow.

[Previous Step](#)

## Using power saving mode

[Copy Link](#)

Use emergency power saving mode when your device is low on battery and you still need to be able use some functions on your device.

From the Home screen, drag down the **Notification panel**.

Drag down the **Quick settings** panel.

Swipe to Battery Saver.

Tap **Battery Saver**.

**Note:** Battery Saver mode saves battery power by limiting access to certain apps, including the flashlight. You can also send your location or a text message to an emergency contact.

You've completed the steps!

A screenshot of a smartphone's quick settings menu. The background is black. At the top, there's a light blue slider bar. Below it are several white tiles with icons and labels: 'Hotspot Off', 'System update >', 'Dolby Atmos Smart audio >', 'Nearby Share >', 'Alarm No alarm set >', 'Battery Saver On' (this tile has a red circular highlight), 'Night light Off', and 'Screen cast Off'. At the bottom, there are three small white icons: a pencil, a power button, and a gear icon.

Three circular navigation buttons. The leftmost button contains a white left-pointing arrow. The middle button is white and contains the text '4/5'. The rightmost button contains a white right-pointing arrow.

Claim	Public Documentation
	<div><h3>Optimize network data usage</h3><p>Over the life of a smartphone, the cost of a cellular data plan can easily exceed the cost of the device itself. On Android 7.0 (API level 24) and higher, users can enable Data Saver on a device-wide basis in order to optimize their device's data usage, and use less data. This ability is especially useful when roaming, near the end of the billing cycle, or for a small prepaid data pack.</p><p>When a user enables Data Saver in <b>Settings</b> and the device is on a metered network, the system blocks background data usage and signals apps to use less data in the foreground wherever possible. Users can allow specific apps to use background metered data usage even when Data Saver is turned on.</p><p>Android 7.0 (API level 24) extends the <code>ConnectivityManager</code> API to provide apps with a way to <a href="#">retrieve the user's Data Saver preferences</a> and <a href="#">monitor preference changes</a>. It is considered good practice for apps to check whether the user has enabled Data Saver and make an effort to limit foreground and background data usage.</p></div> <div><h3>Check data saver preferences</h3><p>On Android 7.0 (API level 24) and higher, apps can use the <code>ConnectivityManager</code> API to determine what data usage restrictions are being applied. The <code>getRestrictBackgroundStatus()</code> method returns one of the following values:</p><div><p><code>RESTRICT_BACKGROUND_STATUS_DISABLED</code></p><p>Data Saver is disabled.</p></div><div><p><code>RESTRICT_BACKGROUND_STATUS_ENABLED</code></p><p>The user has enabled Data Saver for this app. Apps should make an effort to limit data usage in the foreground and gracefully handle restrictions to background data usage.</p></div><div><p><code>RESTRICT_BACKGROUND_STATUS_WHITELISTED</code></p><p>The user has enabled Data Saver but the app is allowed to bypass it. Apps should still make an effort to limit foreground and background data usage.</p></div><p>Limit data usage whenever the device is connected to a metered network, even if Data Saver is disabled or the app is allowed to bypass it. The following sample code uses <code>ConnectivityManager.isActiveNetworkMetered()</code> and <code>ConnectivityManager.getRestrictBackgroundStatus()</code> to determine how much data the app should use:</p></div> <p>; <a href="https://developer.android.com/training/monitoring-device-state/doze-standby">https://developer.android.com/training/monitoring-device-state/doze-standby</a>:</p>

**HIGHLY CONFIDENTIAL – ATTORNEYS’ EYES ONLY**

Claim	Public Documentation
	<div><h2>Optimize for Doze and App Standby </h2><p>Starting from Android 6.0 (API level 23), Android introduces two power-saving features that extend battery life for users by managing how apps behave when a device is not connected to a power source. <i>Doze</i> reduces battery consumption by deferring background CPU and network activity for apps when the device is unused for long periods of time. <i>App Standby</i> defers background network activity for apps with which the user has not recently interacted.</p><p>While the device is in Doze, apps' access to certain battery-intensive resources is deferred until maintenance windows. The specific restrictions are listed in <a href="#">Power Management Restrictions</a>.</p><p>Doze and App Standby manage the behavior of all apps running on Android 6.0 or higher, regardless whether they are specifically targeting API level 23. To ensure the best experience for users, test your app in Doze and App Standby modes and make any necessary adjustments to your code. The sections below provide details.</p></div> <div><h3>Understanding Doze</h3><p>If a user leaves a device unplugged and stationary for a period of time, with the screen off, the device enters Doze mode. In Doze mode, the system attempts to conserve battery by restricting apps' access to network and CPU-intensive services. It also prevents apps from accessing the network and defers their jobs, syncs, and standard alarms.</p><p>Periodically, the system exits Doze for a brief time to let apps complete their deferred activities. During this <i>maintenance window</i>, the system runs all pending syncs, jobs, and alarms, and lets apps access the network.</p><p><b>Figure 1.</b> Doze provides a recurring maintenance window for apps to use the network and handle pending activities.</p></div>

**HIGHLY CONFIDENTIAL – ATTORNEYS’ EYES ONLY**

Claim	Public Documentation
	<div>At the conclusion of each maintenance window, the system again enters Doze, suspending network access and deferring jobs, syncs, and alarms. Over time, the system schedules maintenance windows less and less frequently, helping to reduce battery consumption in cases of longer-term inactivity when the device is not connected to a charger.</div> <div>As soon as the user wakes the device by moving it, turning on the screen, or connecting a charger, the system exits Doze and all apps return to normal activity.</div> <div>The Doze restriction on network access is also likely to affect your app, especially if the app relies on real-time messages such as tickles or notifications. If your app requires a persistent connection to the network to receive messages, you should use <a href="#">Firebase Cloud Messaging (FCM)</a> if possible.</div> <div>; <a href="https://developer.android.com/topic/performance/appstandby">https://developer.android.com/topic/performance/appstandby</a>:</div>

**HIGHLY CONFIDENTIAL – ATTORNEYS’ EYES ONLY**

## App Standby Buckets

Android 9 (API level 28) and higher support **App Standby Buckets**. App Standby Buckets help the system prioritize apps' requests for resources based on how recently and how frequently the apps are used. Based on app usage patterns, each app is placed in one of five priority **buckets**. The system limits the device resources available to each app based on which bucket the app is in.

### Priority buckets

The system dynamically assigns each app to a priority bucket, reassigning the apps as needed. The system may rely on a preloaded app that uses machine learning to determine how likely each app is to be used, and assigns apps to the appropriate buckets. If the system app is not present on a device, the system defaults to sorting apps based on how recently they were used. More active apps are assigned to buckets that give the apps higher priority, making more system resources available to the app. In particular, the bucket determines how frequently the app's jobs run, and how often the app can trigger alarms. These restrictions apply only while the device is on battery power; the system does not impose these restrictions on apps while the device is charging.

★ **Note:** Every manufacturer can set their own criteria for how non-active apps are assigned to buckets. You should not try to influence which bucket your app is assigned to. Instead, focus on making sure your app behaves well in whatever bucket it might be in. Your app can find out what bucket it's currently in by calling [`UsageStatsManager.getAppStandbyBucket\(\)`](#).

The buckets are:

1. **Active:** App is currently being used or was very recently used.
2. **Working set:** App is in regular use.
3. **Frequent:** App is often used, but not every day.
4. **Rare:** App is not frequently used.
5. **Restricted:** App consumes a great deal of system resources, or may exhibit undesirable behavior.

In addition, there's a special **never** bucket for apps that have been installed but have never been run. The system imposes severe restrictions on these apps.

**HIGHLY CONFIDENTIAL – ATTORNEYS’ EYES ONLY**

## Types of Services

These are the three different types of services:

### Foreground

A foreground service performs some operation that is noticeable to the user. For example, an audio app would use a foreground service to play an audio track. Foreground services must display a [Notification](#). Foreground services continue running even when the user isn't interacting with the app.

When you use a foreground service, you must display a notification so that users are actively aware that the service is running. This notification cannot be dismissed unless the service is either stopped or removed from the foreground.

Learn more about how to configure [foreground services](#) in your app.

★ **Note:** The [WorkManager](#) API offers a flexible way of scheduling tasks, and is able to [run these jobs as foreground services](#) if needed. In many cases, using WorkManager is preferable to using foreground services directly.

### Background

A background service performs an operation that isn't directly noticed by the user. For example, if an app used a service to compact its storage, that would usually be a background service.

★ **Note:** If your app targets API level 26 or higher, the system imposes [restrictions on running background services](#) when the app itself isn't in the foreground. In most situations, for example, you shouldn't [access location information from the background](#). Instead, [schedule tasks using WorkManager](#).

### Bound

A service is *bound* when an application component binds to it by calling `bindService()`. A bound service offers a client-server interface that allows components to interact with the service, send requests, receive results, and even do so across processes with interprocess communication (IPC). A bound service runs only as long as another application component is bound to it. Multiple components can bind to the service at once, but when all of them unbind, the service is destroyed.

Edge 5G UW

Using power saving mode

Use emergency power saving mode when your device is low on battery and you still need to be able use some functions on your device.

From the Home screen, drag down the **Notification panel**.

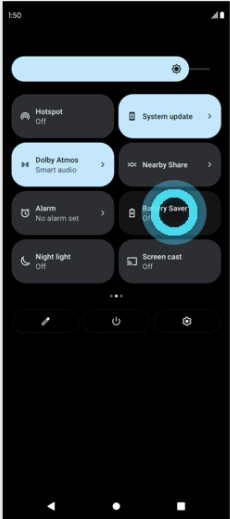

Drag down the **Quick settings** panel.

Swipe to Battery Saver.

Tap **Battery Saver**.

**Note:** Battery Saver mode saves battery power by limiting access to certain apps, including the flashlight. You can also send your location or a text message to an emergency contact.

You've completed the steps!

Claim	Public Documentation
	<div><h3>Optimize network data usage </h3><p>Over the life of a smartphone, the cost of a cellular data plan can easily exceed the cost of the device itself. On Android 7.0 (API level 24) and higher, users can enable Data Saver on a device-wide basis in order to optimize their device's data usage, and use less data. This ability is especially useful when roaming, near the end of the billing cycle, or for a small prepaid data pack.</p><p>When a user enables Data Saver in <b>Settings</b> and the device is on a metered network, the system blocks background data usage and signals apps to use less data in the foreground wherever possible. Users can allow specific apps to use background metered data usage even when Data Saver is turned on.</p><p>Android 7.0 (API level 24) extends the <code>ConnectivityManager</code> API to provide apps with a way to <a href="#">retrieve the user's Data Saver preferences</a> and <a href="#">monitor preference changes</a>. It is considered good practice for apps to check whether the user has enabled Data Saver and make an effort to limit foreground and background data usage.</p></div> <div><h3>Check data saver preferences</h3><p>On Android 7.0 (API level 24) and higher, apps can use the <code>ConnectivityManager</code> API to determine what data usage restrictions are being applied. The <code>getRestrictBackgroundStatus()</code> method returns one of the following values:</p><div><p><code>RESTRICT_BACKGROUND_STATUS_DISABLED</code></p><p>Data Saver is disabled.</p></div><div><p><code>RESTRICT_BACKGROUND_STATUS_ENABLED</code></p><p>The user has enabled Data Saver for this app. Apps should make an effort to limit data usage in the foreground and gracefully handle restrictions to background data usage.</p></div><div><p><code>RESTRICT_BACKGROUND_STATUS_WHITELISTED</code></p><p>The user has enabled Data Saver but the app is allowed to bypass it. Apps should still make an effort to limit foreground and background data usage.</p></div><p>Limit data usage whenever the device is connected to a metered network, even if Data Saver is disabled or the app is allowed to bypass it. The following sample code uses <code>ConnectivityManager.isActiveNetworkMetered()</code> and <code>ConnectivityManager.getRestrictBackgroundStatus()</code> to determine how much data the app should use:</p></div> <p>; <a href="https://developer.android.com/training/monitoring-device-state/doze-standby">https://developer.android.com/training/monitoring-device-state/doze-standby</a>;</p>

**HIGHLY CONFIDENTIAL – ATTORNEYS’ EYES ONLY**

Claim	Public Documentation
	<div><h2>Optimize for Doze and App Standby </h2><p>Starting from Android 6.0 (API level 23), Android introduces two power-saving features that extend battery life for users by managing how apps behave when a device is not connected to a power source. <i>Doze</i> reduces battery consumption by deferring background CPU and network activity for apps when the device is unused for long periods of time. <i>App Standby</i> defers background network activity for apps with which the user has not recently interacted.</p><p>While the device is in Doze, apps' access to certain battery-intensive resources is deferred until maintenance windows. The specific restrictions are listed in <a href="#">Power Management Restrictions</a>.</p><p>Doze and App Standby manage the behavior of all apps running on Android 6.0 or higher, regardless whether they are specifically targeting API level 23. To ensure the best experience for users, test your app in Doze and App Standby modes and make any necessary adjustments to your code. The sections below provide details.</p></div> <div><h3>Understanding Doze</h3><p>If a user leaves a device unplugged and stationary for a period of time, with the screen off, the device enters Doze mode. In Doze mode, the system attempts to conserve battery by restricting apps' access to network and CPU-intensive services. It also prevents apps from accessing the network and defers their jobs, syncs, and standard alarms.</p><p>Periodically, the system exits Doze for a brief time to let apps complete their deferred activities. During this <i>maintenance window</i>, the system runs all pending syncs, jobs, and alarms, and lets apps access the network.</p><p><b>Figure 1.</b> Doze provides a recurring maintenance window for apps to use the network and handle pending activities.</p></div>

**HIGHLY CONFIDENTIAL – ATTORNEYS’ EYES ONLY**

Claim	Public Documentation
	<div>At the conclusion of each maintenance window, the system again enters Doze, suspending network access and deferring jobs, syncs, and alarms. Over time, the system schedules maintenance windows less and less frequently, helping to reduce battery consumption in cases of longer-term inactivity when the device is not connected to a charger.</div> <div>As soon as the user wakes the device by moving it, turning on the screen, or connecting a charger, the system exits Doze and all apps return to normal activity.</div> <div>The Doze restriction on network access is also likely to affect your app, especially if the app relies on real-time messages such as tickles or notifications. If your app requires a persistent connection to the network to receive messages, you should use <a href="#">Firebase Cloud Messaging (FCM)</a> if possible.</div> <div>; <a href="https://developer.android.com/topic/performance/appstandby">https://developer.android.com/topic/performance/appstandby</a>:</div>

**HIGHLY CONFIDENTIAL – ATTORNEYS’ EYES ONLY**

## App Standby Buckets

Android 9 (API level 28) and higher support **App Standby Buckets**. App Standby Buckets help the system prioritize apps' requests for resources based on how recently and how frequently the apps are used. Based on app usage patterns, each app is placed in one of five priority **buckets**. The system limits the device resources available to each app based on which bucket the app is in.

### Priority buckets

The system dynamically assigns each app to a priority bucket, reassigning the apps as needed. The system may rely on a preloaded app that uses machine learning to determine how likely each app is to be used, and assigns apps to the appropriate buckets. If the system app is not present on a device, the system defaults to sorting apps based on how recently they were used. More active apps are assigned to buckets that give the apps higher priority, making more system resources available to the app. In particular, the bucket determines how frequently the app's jobs run, and how often the app can trigger alarms. These restrictions apply only while the device is on battery power; the system does not impose these restrictions on apps while the device is charging.

★ **Note:** Every manufacturer can set their own criteria for how non-active apps are assigned to buckets. You should not try to influence which bucket your app is assigned to. Instead, focus on making sure your app behaves well in whatever bucket it might be in. Your app can find out what bucket it's currently in by calling [`UsageStatsManager.getAppStandbyBucket\(\)`](#).

The buckets are:

1. **Active:** App is currently being used or was very recently used.
2. **Working set:** App is in regular use.
3. **Frequent:** App is often used, but not every day.
4. **Rare:** App is not frequently used.
5. **Restricted:** App consumes a great deal of system resources, or may exhibit undesirable behavior.

In addition, there's a special **never** bucket for apps that have been installed but have never been run. The system imposes severe restrictions on these apps.

Claim	Public Documentation
	<p>; <a href="https://developer.android.com/topic/performance/power/power-details">https://developer.android.com/topic/performance/power/power-details</a>:</p> <h2>Power management restrictions </h2> <p>As described in <a href="#">Power management</a>, the system can impose power restrictions on apps for a number of reasons. The following table outlines the current restrictions. These restrictions do not apply while the device is charging.</p> <p>In each case, the most restrictive applicable setting is the one that takes effect. For example, if Battery Saver is active and an app is in the Rare bucket, the more stringent App Standby Buckets restrictions on Firebase Cloud Messaging (FCM) are applied.</p>

**HIGHLY CONFIDENTIAL – ATTORNEYS’ EYES ONLY**

Setting	Jobs *	Alarms	Network †	Firebase Cloud Messaging §
User Restricts Background Activity				
Restrictions enabled:	Never	Never	No restriction	No restriction
Doze				
Doze active:	Deferred to window	Regular alarms: Deferred to window  Inexact while-idle alarms: Limited to 1 per 9 minutes  Exact while-idle alarms: Limited to 72 per hour	Deferred to window	High priority: No restriction  Normal priority: Deferred to window
App Standby Buckets (by bucket)				Prior to Android 13 (API Level 33)
Active:	No restriction	No restriction	No restriction	No restriction
Working set:	Limited to 10 minutes every 2 hours	Limited to 10 per hour	No restriction	No restriction
Frequent:	Limited to 10 minutes every 8 hours	Limited to 2 per hour	No restriction	High priority: 10/day
Rare:	Limited to 10 minutes every 24 hours	Limited to 1 per hour	Disabled	High priority: 5/day
Restricted:	Once per day	One alarm per day, either an <a href="#">exact alarm</a> or an <a href="#">inexact alarm</a>	Disabled	High priority: 5/day

What Verizon Smart Family features are available without downloading the Verizon Smart Family Companion app on my child's device? 

Certain features are only available if the Verizon Smart Family Companion app is installed on your child's smartphone and paired with the Verizon Smart Family app on your device.

- **Without pairing, you can:**

- View call and text activity
- Set time restrictions on texts, calls and data usage\*
- Set data limits\*
- Set text, call and purchase limits
- Get access to the device's network location

Note: Network location accuracy may vary up to a few miles.

- **You must pair to:**

- Set content filters
- Monitor web and app activity
- Pause internet access
- Set time restrictions on Wi-Fi usage
- Locate family members and set location alerts with the best location accuracy
- Use the location check-in feature, where family members can send you their precise location when they arrive at their destination
- Use the **Pick Me Up** feature that lets your child send a request for a ride to a parent line

	<div><h3>Optimize network data usage</h3><p>Over the life of a smartphone, the cost of a cellular data plan can easily exceed the cost of the device itself. On Android 7.0 (API level 24) and higher, users can enable Data Saver on a device-wide basis in order to optimize their device's data usage, and use less data. This ability is especially useful when roaming, near the end of the billing cycle, or for a small prepaid data pack.</p><p>When a user enables Data Saver in <b>Settings</b> and the device is on a metered network, the system blocks background data usage and signals apps to use less data in the foreground wherever possible. Users can allow specific apps to use background metered data usage even when Data Saver is turned on.</p><p>Android 7.0 (API level 24) extends the <code>ConnectivityManager</code> API to provide apps with a way to <a href="#">retrieve the user's Data Saver preferences</a> and <a href="#">monitor preference changes</a>. It is considered good practice for apps to check whether the user has enabled Data Saver and make an effort to limit foreground and background data usage.</p></div> <div><h3>Check data saver preferences</h3><p>On Android 7.0 (API level 24) and higher, apps can use the <code>ConnectivityManager</code> API to determine what data usage restrictions are being applied. The <code>getRestrictBackgroundStatus()</code> method returns one of the following values:</p><div><p><code>RESTRICT_BACKGROUND_STATUS_DISABLED</code></p><p>Data Saver is disabled.</p></div><div><p><code>RESTRICT_BACKGROUND_STATUS_ENABLED</code></p><p>The user has enabled Data Saver for this app. Apps should make an effort to limit data usage in the foreground and gracefully handle restrictions to background data usage.</p></div><div><p><code>RESTRICT_BACKGROUND_STATUS_WHITELISTED</code></p><p>The user has enabled Data Saver but the app is allowed to bypass it. Apps should still make an effort to limit foreground and background data usage.</p></div><p>Limit data usage whenever the device is connected to a metered network, even if Data Saver is disabled or the app is allowed to bypass it. The following sample code uses <code>ConnectivityManager.isActiveNetworkMetered()</code> and <code>ConnectivityManager.getRestrictBackgroundStatus()</code> to determine how much data the app should use:</p></div> <p>; <a href="https://developer.android.com/training/monitoring-device-state/doze-standby">https://developer.android.com/training/monitoring-device-state/doze-standby</a>;</p>

**HIGHLY CONFIDENTIAL – ATTORNEYS’ EYES ONLY**

Claim	Public Documentation
	<div><h2>Optimize for Doze and App Standby </h2><p>Starting from Android 6.0 (API level 23), Android introduces two power-saving features that extend battery life for users by managing how apps behave when a device is not connected to a power source. <i>Doze</i> reduces battery consumption by deferring background CPU and network activity for apps when the device is unused for long periods of time. <i>App Standby</i> defers background network activity for apps with which the user has not recently interacted.</p><p>While the device is in Doze, apps' access to certain battery-intensive resources is deferred until maintenance windows. The specific restrictions are listed in <a href="#">Power Management Restrictions</a>.</p><p>Doze and App Standby manage the behavior of all apps running on Android 6.0 or higher, regardless whether they are specifically targeting API level 23. To ensure the best experience for users, test your app in Doze and App Standby modes and make any necessary adjustments to your code. The sections below provide details.</p></div> <div><h3>Understanding Doze</h3><p>If a user leaves a device unplugged and stationary for a period of time, with the screen off, the device enters Doze mode. In Doze mode, the system attempts to conserve battery by restricting apps' access to network and CPU-intensive services. It also prevents apps from accessing the network and defers their jobs, syncs, and standard alarms.</p><p>Periodically, the system exits Doze for a brief time to let apps complete their deferred activities. During this <i>maintenance window</i>, the system runs all pending syncs, jobs, and alarms, and lets apps access the network.</p><p><b>Figure 1.</b> Doze provides a recurring maintenance window for apps to use the network and handle pending activities.</p></div>

**HIGHLY CONFIDENTIAL – ATTORNEYS’ EYES ONLY**

Claim	Public Documentation
	<div>At the conclusion of each maintenance window, the system again enters Doze, suspending network access and deferring jobs, syncs, and alarms. Over time, the system schedules maintenance windows less and less frequently, helping to reduce battery consumption in cases of longer-term inactivity when the device is not connected to a charger.</div> <div>As soon as the user wakes the device by moving it, turning on the screen, or connecting a charger, the system exits Doze and all apps return to normal activity.</div> <div>The Doze restriction on network access is also likely to affect your app, especially if the app relies on real-time messages such as tickles or notifications. If your app requires a persistent connection to the network to receive messages, you should use <a href="#">Firebase Cloud Messaging (FCM)</a> if possible.</div> <div>; <a href="https://developer.android.com/topic/performance/appstandby">https://developer.android.com/topic/performance/appstandby</a>:</div>

**HIGHLY CONFIDENTIAL – ATTORNEYS’ EYES ONLY**

## App Standby Buckets

Android 9 (API level 28) and higher support **App Standby Buckets**. App Standby Buckets help the system prioritize apps' requests for resources based on how recently and how frequently the apps are used. Based on app usage patterns, each app is placed in one of five priority **buckets**. The system limits the device resources available to each app based on which bucket the app is in.

### Priority buckets

The system dynamically assigns each app to a priority bucket, reassigning the apps as needed. The system may rely on a preloaded app that uses machine learning to determine how likely each app is to be used, and assigns apps to the appropriate buckets. If the system app is not present on a device, the system defaults to sorting apps based on how recently they were used. More active apps are assigned to buckets that give the apps higher priority, making more system resources available to the app. In particular, the bucket determines how frequently the app's jobs run, and how often the app can trigger alarms. These restrictions apply only while the device is on battery power; the system does not impose these restrictions on apps while the device is charging.

★ **Note:** Every manufacturer can set their own criteria for how non-active apps are assigned to buckets. You should not try to influence which bucket your app is assigned to. Instead, focus on making sure your app behaves well in whatever bucket it might be in. Your app can find out what bucket it's currently in by calling [`UsageStatsManager.getAppStandbyBucket\(\)`](#).

The buckets are:

1. **Active:** App is currently being used or was very recently used.
2. **Working set:** App is in regular use.
3. **Frequent:** App is often used, but not every day.
4. **Rare:** App is not frequently used.
5. **Restricted:** App consumes a great deal of system resources, or may exhibit undesirable behavior.

In addition, there's a special **never** bucket for apps that have been installed but have never been run. The system imposes severe restrictions on these apps.

Claim	Public Documentation
	<p>; <a href="https://developer.android.com/topic/performance/power/power-details">https://developer.android.com/topic/performance/power/power-details</a>:</p> <h2>Power management restrictions </h2> <p>As described in <a href="#">Power management</a>, the system can impose power restrictions on apps for a number of reasons. The following table outlines the current restrictions. These restrictions do not apply while the device is charging.</p> <p>In each case, the most restrictive applicable setting is the one that takes effect. For example, if Battery Saver is active and an app is in the Rare bucket, the more stringent App Standby Buckets restrictions on Firebase Cloud Messaging (FCM) are applied.</p>

**HIGHLY CONFIDENTIAL – ATTORNEYS’ EYES ONLY**

Setting	Jobs *	Alarms	Network †	Firebase Cloud Messaging §
User Restricts Background Activity				
Restrictions enabled:	Never	Never	No restriction	No restriction
Doze				
Doze active:	Deferred to window	Regular alarms: Deferred to window  Inexact while-idle alarms: Limited to 1 per 9 minutes  Exact while-idle alarms: Limited to 72 per hour	Deferred to window	High priority: No restriction  Normal priority: Deferred to window
App Standby Buckets (by bucket)				Prior to Android 13 (API Level 33)
Active:	No restriction	No restriction	No restriction	No restriction
Working set:	Limited to 10 minutes every 2 hours	Limited to 10 per hour	No restriction	No restriction
Frequent:	Limited to 10 minutes every 8 hours	Limited to 2 per hour	No restriction	High priority: 10/day
Rare:	Limited to 10 minutes every 24 hours	Limited to 1 per hour	Disabled	High priority: 5/day
Restricted:	Once per day	One alarm per day, either an <a href="#">exact alarm</a> or an <a href="#">inexact alarm</a>	Disabled	High priority: 5/day

**HIGHLY CONFIDENTIAL – ATTORNEYS’ EYES ONLY**

## Activity-lifecycle concepts

To navigate transitions between stages of the activity lifecycle, the `Activity` class provides a core set of six callbacks: `onCreate()`, `onStart()`, `onResume()`, `onPause()`, `onStop()`, and `onDestroy()`. The system invokes each of these callbacks as the activity enters a new state.

Figure 1 presents a visual representation of this paradigm.

As the user begins to leave the activity, the system calls methods to dismantle the activity. In some cases, the activity is only partially dismantled and still resides in memory, such as when the user switches to another app. In these cases, the activity can still come back to the foreground.

If the user returns to the activity, it resumes from where the user left off. With a few exceptions, apps are [restricted from starting activities when running in the background](#).

The system’s likelihood of killing a given process, along with the activities in it, depends on the state of the activity at the time. For more information on the relationship between state and vulnerability to ejection, see the section about [activity state and ejection from memory](#).

Depending on the complexity of your activity, you probably don’t need to implement all the lifecycle methods. However, it’s important that you understand each one and implement those that make your app behave the way users expect.

**Figure 1.** A simplified illustration of the activity lifecycle.
